

1 ABSTRACT OF THE DISCLOSURE

2 A golf club head includes a balance weight for swing balancing the golf club. The balance
3 weight is selected from a plurality of balance weights and mounted in a weight cavity formed in the
4 golf club head. A cover, imprinted with information such as the club model designation, is
5 mounted to the club head body so that it substantially covers the balance weight. By providing a
6 single cover for each model of golf club, in combination with a plurality of weights that are
7 interchangeable between golf club models, the total number of balance weights that must be
8 maintained in inventory is significantly reduced.
